**SYNTHETIC TRAINING GUIDELINE - NOT MEDICAL ADVICE**

## Intake log exercise

This fictional capstone scenario uses the code River-7 for a practice hydration log. The trainee records the synthetic participant identifier, beverage label, simulated volume, and entry time. River-7 is an invented workflow marker and is not a clinical protocol.

For the indexing exercise, each entry also records whether the amount was reported by the fictional participant or copied from the training worksheet. Missing fields are marked NOT RECORDED; they are never inferred. The purpose is to retrieve passages about provenance, timestamps, and structured intake records.

A reviewer checks that the source label and time are present, then signs the synthetic record with the phrase BLUE CUP CHECK. This distinctive phrase exists solely to make retrieval results easy to inspect during the capstone demonstration.

**SYNTHETIC TRAINING GUIDELINE - NOT MEDICAL ADVICE**

## Follow-up reconciliation exercise

During the fictional follow-up, River-7 entries are compared with the practice worksheet. The reviewer lists discrepancies without deciding which value is medically correct. A mismatch is labeled TRAINING REVIEW NEEDED and remains visible in the audit notes.

The reconciliation record includes the original synthetic entry, the worksheet entry, the page reference, and a neutral description of the difference. It does not diagnose, recommend treatment, or replace review by a qualified professional.

The completion marker for this page is RIVER ARCHIVE COMPLETE. A useful manual query is: What information is retained during River-7 reconciliation? The retrieved result should cite this document and page two.
