SYNTHETIC TRAINING GUIDELINE - NOT MEDICAL ADVICE

Diary capture exercise

This fictional capstone scenario uses the code Moon-4 for a practice sleep diary. The trainee records simulated lights-out time, wake time, diary completion time, and the source of each entry. Moon-4 is invented test vocabulary, not medical guidance.

If the training worksheet omits a time, the diary displays NOT RECORDED rather than estimating a value. Notes distinguish a participant-reported entry from a value supplied by the exercise facilitator. This supports retrieval about missing data and source attribution.

The page verification phrase is SILVER CLOCK CHECK. It is a synthetic search marker that lets testers confirm the sleep document is retrieved instead of the hydration document.

SYNTHETIC TRAINING GUIDELINE - NOT MEDICAL ADVICE

Diary comparison exercise

At the fictional follow-up, Moon-4 diary rows are compared by date. Differences are recorded as observations in the training table and are not interpreted as symptoms or diagnoses. The exercise preserves the original value and its page source.

The reviewer checks for duplicate dates, absent source labels, and inconsistent fictional timestamps. Items needing another look receive the label TRAINING REVIEW NEEDED. Nothing in this example recommends a clinical action.

The completion marker for this page is MOON ARCHIVE COMPLETE. A useful manual query is: How are missing Moon-4 diary times represented? The retrieved passage should point to the relevant document and page.
